

By David, Alicia y Abraham

Sea Scape:

We have created a web app that functions as a social network dedicated to Spanish beaches. The platform includes a database with general descriptions of the beaches, details about beach access, and a list of activities that can be enjoyed at each location. Users are able to leave comments and rate the beaches, fostering an interactive community for sharing experiences and recommendations regarding different beaches in Spain.

The problem:

The beauty of Spanish beaches is undisputed, yet the challenge lies in preserving and managing these coastal treasures sustainably. Issues such as overcrowding, environmental impact, and accessibility are forefront concerns.

The solution:

Our mission is to enhance the beachgoer experience while addressing these challenges, ensuring that the splendor of Spain's beaches remains for generations to come.

Challenges:

The most significant challenges we encountered during the development process revolved around:

- **Effectively implementing middlewares**
- **Streamlining authentication processes.**

Overcoming these challenges has been crucial in delivering a smooth and reliable user experience.

Our mistakes:

In the realm of setbacks, we are proud to report that we encountered no major challenges that posed significant obstacles. Through collaborative efforts, the three of us successfully navigated the development process, overcoming hurdles efficiently and ensuring the seamless functionality of our web app.

A vibrant tropical beach scene. In the foreground, a sandy beach is visible. The middle ground shows turquoise water with white foam from waves breaking. The background is a clear blue sky with several palm trees leaning over the water from the left and right sides.
